Fujitsu Introduces New Wall-Mounted Mini-Split Systems

Fujitsu General America, Inc., has introduced two new, wall-mounted mini-split systems. These new single-zone systems improve upon and replace existing Fujitsu models, offering higher efficiency, more control options and aesthetic changes.

The new, best-in-class LZAS1 and LZAH1 heat pump systems replace Fujitsu's RLS3Y and RLS3H models, and are available in 9,000, 12,000 and 15,000 BTU capacities. Offering up to 33.1 SEER, these systems also feature built-in WiFi capability and an improved fan. The LZAH1 line, which is capable of heating in outdoor temperatures as low as -15°F, also features a built-in base pan heater.

The new LMAS1 models replace Fujitsu's existing RLFW1 line and are available in 9,000 and 12,000 BTU capacities. These systems provide efficiencies up to 26.5 SEER and can be connected to our improved controls suit. ; WiFi capability is optional.

Both the LZA and LMA series feature a sleek new chassis design for a modern appearance, and can be used with Fujitsu's third party thermostat converter. The new single zone indoor units are only compatible with the same generation outdoor units. New and current models are not cross compatible.

The current wall mounted systems; RLS3Y, and RLS3H are available while supplies last. Service components are available throughout the warranty period.

The current wall mounted systems; RLFW1 systems are available while supplies last. Service components are available throughout the warranty period. ASU9RLF1 and ASU12RLF1 indoor units will continue to be available as a match up for multi zone outdoor units.

For more information, visit www.FujitsuGeneral.com or contact your local Fujitsu rep/distributor or your Fujitsu Regional Sales Manager.
